Module title: Optoelectronics Workload Module no./Code Credits Recommended Cycle Duration 149277 6 CP 180 h study semester winter term 1 Semester 1. semester (MaLAP) **Courses / lectures** Contact hour Self-Study Group size Studierende 141267: Optoelectronics 60 h Language Requirements english none Responsible person and lecturer(s) Module coordinator: Prof. Dr.-Ing. Nils C. Gerhardt Lecturer: Prof. Dr.-Ing. Nils C. Gerhardt Module use Master Lasers and Photonics (PO 2015) Learning outcomes Learn the functional principle of optoelectronic devices. Accumulate knowledge of the basic physics and on the function of the most important devices (solar cell, photodiode, light emitting diode, semiconductor laser). Content At first, the basic principles of semiconductors (lattice structure, band structure, doping) are introduced. In the second chapter, the elementary interactions between light and semiconductors are addressed. The third chapter contains the p-n-junction and hetero junctions. Then, the most important devices: solar cells, photodiodes, light emitting diodes, and semiconductor lasers are discussed in separate chapters. New devices like modulators and optical switches are referred to in the second last chapter and the last chapter consists of an overview about organic optoelectronics. Teaching type lecture with tutorials Mode of assessment oral (30 min) **Requirements for credits** Successful passing of the module examination. Proportion of graded modules (based on a required coursework of 120 ECTS) 6/86

Learning outcomes

The students acquire specific competences in individually chosen special areas of Lasers and Photonics.

Content

The students chose specific topics out of the lecture programme of the participating faculties of the Ruhr-Universität in order to include an individual focus area into their studies. The courses listed below will be accepted automatically, other choices have to be accepted by the LAP coordinator.

Learning outcomes

The students have acquired specific competences in laboratory work and know how to give scientific presentations in the area of Lasers and Photonics. They have learned to find individual solutions to a scientific project and have expertise in scientific communication. They are familiar with different experimental techniques and are able to present a project to a scientific international community. They know how to study actual scientific literature.

Content

The students perform practical courses together in small groups, participate in scientific seminars and give presentations of their work to each other. The detailed content depends on their specific choices between the offered practical courses.
